NHBA Analyst Meeting 10/25, Client Meeting 10/27

Updates:

- Progress on the Week
    - Alex: Provide updates and process of joining (go through Quarto document)
    - Joel: Talk about cleaning process
    - Sabrina (if started): Talk about visualizations
- Tabling Sabrina's task last week and moving it to this week
- Git Pushing
    - Write access?
    - Figuring this out with Tate
    - Joel -> pull request (show others how to do this)
        - git add .
        - git commit -m "[empty message]"
        - git pull origin main
        - git push origin <branch_name>
- SSMU Final Presentation
    - Still deciding date, but could be around Thanksgiving (Week of 11/30)
- Upcoming Meetings
    - Tuesday, 10/27 with Client (5:30PM)
    - Next Sunday (11/1)

Final Deliverable Outline: [Google Doc]

Required Tasks:

Link to reference: https://www.science.org/doi/10.1126/science.aaw1313

JOEL -> Qualitative analysis and more data cleaning

- ☐ FRIDAY: Research (using link in deliverable outline) the bird habitat/type for each species to be used for trend line (look at visualization example above to see categories need)
- ☐ FRIDAY: Create a NEW dataset for each of the 6 that sums the species into these groups (write them out into new data folder)
    - ☐ Keep seasons and location separate, so there should still be 6 datasets total
- ☐ SUNDAY: Examine confounding factors to control for: Counting effort (e.g., birds per party hour, weather, and observer count changes year-to-year)
    - ☐ Write a written report of these observations (Ex: Data in X year might be off due to Y weather event)

SABRINA -> Create species trend plots script (DUE SUNDAY)

- ☐ FRIDAY: Ensure all cleaned datasets from last week are uploaded into folder to be used for visualizations and analysis (cleaned datasets from Joel's work last week)
- ☐ SUNDAY: Create script that reads in a species and plots 6 trends (3 regions, 2 seasons) for a trend line
    - ☐ Attempt to create a script so that any species can be selected a plotted
    - ☐ Can separate plots by season/region or overlay them, whatever looks best
    - ☐ The plot should display species account over the years the data is recorded (some locations have different years measured)
- ☐ NO EDA NEEDED THIS WEEK, ONLY VISUALIZATIONS/CODE

ALEX -> Create grouped trend line (DUE SUNDAY)

- ☐ SUNDAY: Read deliverable description to create presentable plots for report (trend line plots)
    - ☐ Trend lines will start from 1980 (also mentioned in report outline)
    - ☐ They will be grouped by habitat
    - ☐ 6 plots should be made in total:
        - ☐ Spring/winter should remain separate, so a spring and winter plot is needed for each of the three locations
        - ☐ Will use dataset compiled by Joel (habitat groupings)
        - ☐ If trend lines are similar for all three locations, combine them into a "total" plot (only 2 plots needed: one for spring and one for winter) -> this is also explained in the report outline
            - ☐ To do this, you may have to merge counts across locations in a new dataframe that again should be written to data file for widespread use
    - ☐ The confidence interval/error is NOT needed for now (basically, recreate middle of 3 plots shown in picture above)
- ☐ NO EDA NEEDED THIS WEEK, ONLY VISUALIZATIONS/CODE
