NHBA Analyst Meeting 11/1

Final Deliverable Outline: [Google Doc]

Required Tasks:

Link to reference: https://www.science.org/doi/10.1126/science.aaw1313

- Current Progress
    - SABRINA: Made plots separated by season/location, as well as overlay
    - JOEL: Separated birds into habitats, condensed counts for trendline
- Tasks for This Week
    - ALEX: SUNDAY: Read deliverable description to create presentable plots for report (trend line plots)
        - Trend lines will start from 1980 (also mentioned in report outline)
        - They will be grouped by habitat
        - 6 plots should be made in total:
            - Spring/winter should remain separate, so a spring and winter plot is needed for each of the three locations
            - Will use dataset compiled by Joel (habitat groupings)
            - If trend lines are similar for all three locations, combine them into a “total” plot (only 2 plots needed: one for spring and one for winter) -> this is also explained in the report outline
                - To do this, you may have to merge counts across locations in a new dataframe that again should be written to data file for widespread use
        - The confidence interval/error is NOT needed for now (basically, recreate middle of 3 plots shown in picture above)
        - NO EDA NEEDED THIS WEEK, ONLY VISUALIZATIONS/CODE

    - SABRINA: SUNDAY: Edit plots to make them curved trend lines, show shading for error, and get script running for every species
    - JOEL: SUNDAY: Start report, examine confounding variables in research
        - Counting effort (e.g., birds per party hour, weather, and observer count changes year-to-year)
            - Write a written report of these observations (Ex: Data in X year might be off due to Y weather event)
- Upcoming Meetings
    - Next Sunday, 11/8
